

# Regulatory Challenges in the Development of Offshore Electrical Networks

NSON: Wind Europe 2019 – 28/11/19

Dr Callum MacIver: [callum.maciver@strath.ac.uk](mailto:callum.maciver@strath.ac.uk)

Supported by: Prof Keith Bell & Dr Ander Madariaga (ORE Catapult)

# Project Background

- Short review project funded by “offshore electrical infrastructure research hub<sup>1</sup>”
  - Collaboration between Strathclyde, Manchester & ORE Catapult
  - 5-year programme with co-funding to address to all aspects of offshore electrical infrastructure
  - “Hub & spoke” model - open to collaboration with industry and academic partners

## Project Aim:

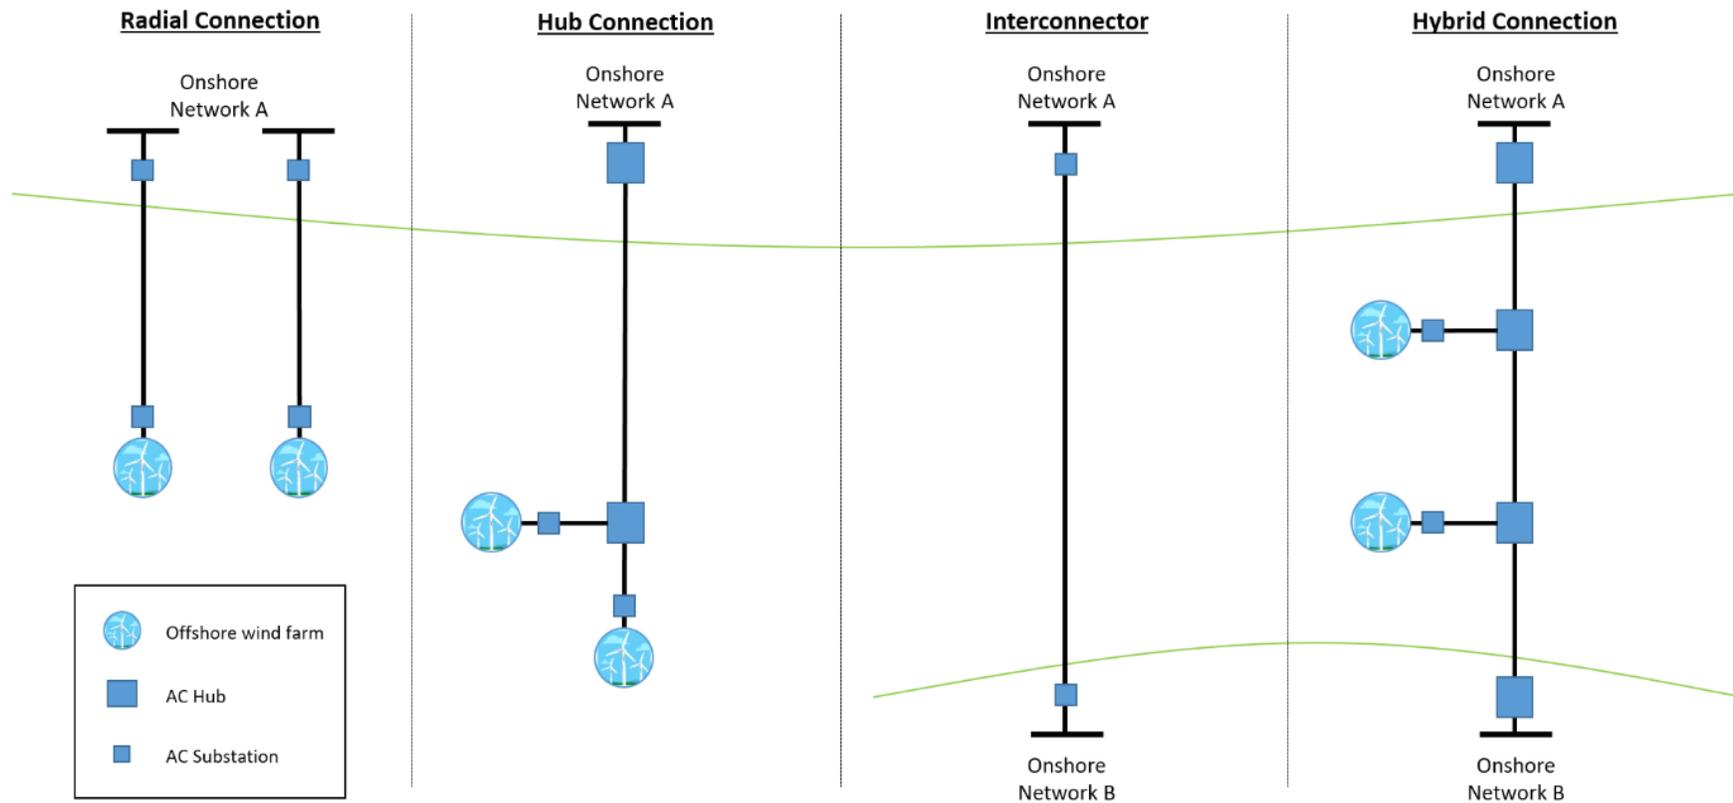

“Identify regulatory issues affecting design, deployment & utilisation of offshore networks in the UK”

- Via overview of high level regulatory models
- Comparison with practices in other countries across Europe

# Types of Offshore Network

4 main configurations options available for offshore networks

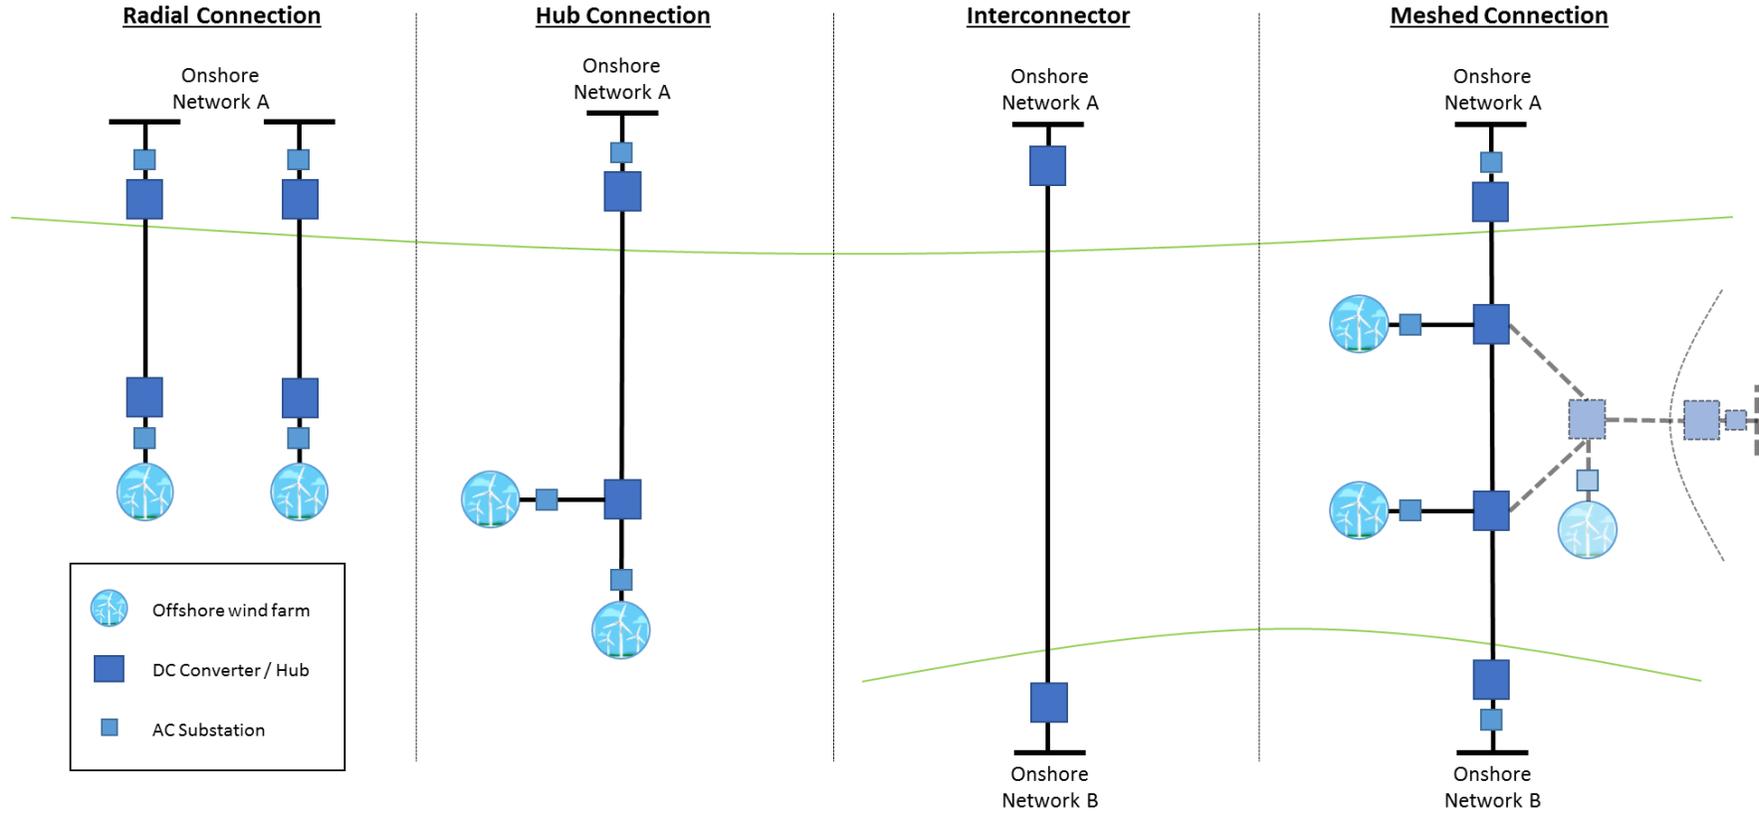

# Types of Offshore Network

4 main configurations options available for offshore networks

# Types of Offshore Network

4 main configurations options available for offshore networks

# Regulatory Regimes - Overview

Three main possibilities for offshore transmission asset (OTA) development

## Developer led approach

- Offshore wind farm (OWF) developer takes responsibility for development and operation of OTA's
- Remuneration for OTA factored into the OWF tender process

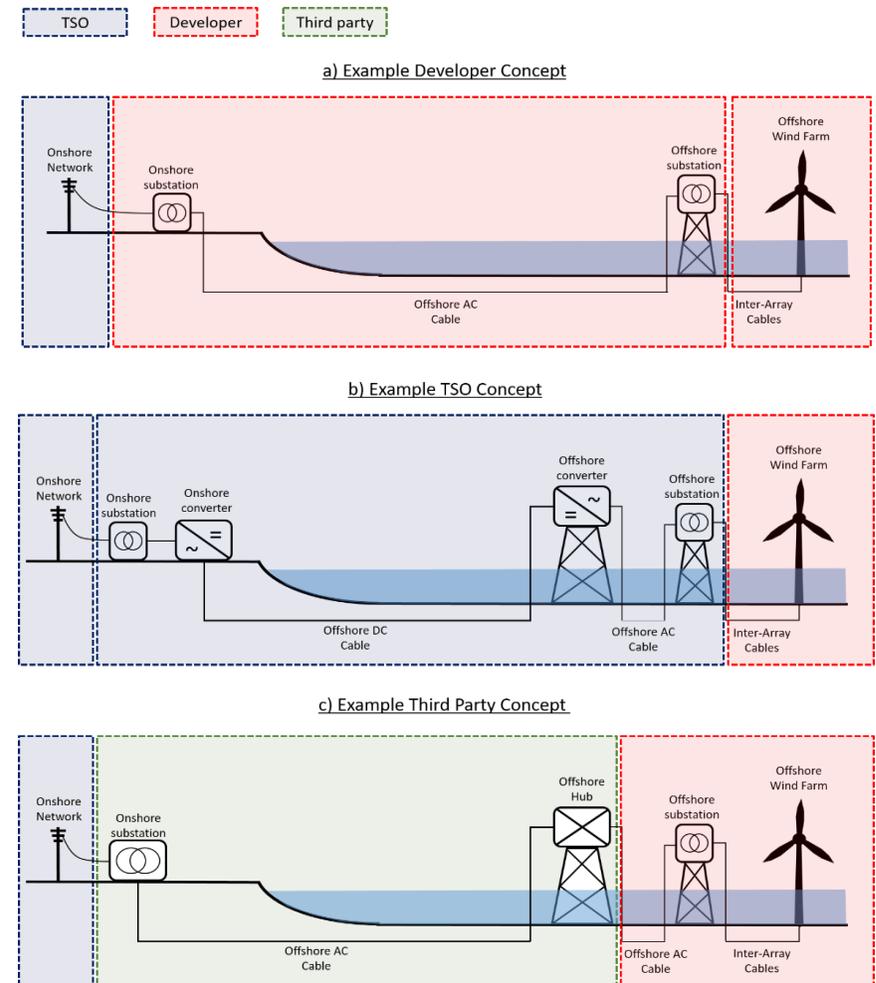

## TSO led approach

- Transmission system operator takes responsibility for development and operation of OTA's
- OTA part of TSO's regulated asset base

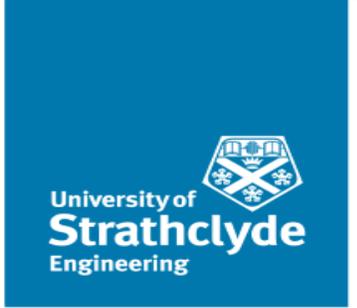

## Third Party approach

- A third party takes responsibility for development and operation of OTA's
- Separate tender for OTA development

Should be noted that build and operation phase can be separated with possibility for hybrid approaches e.g. UK OFTO regime

# Qualitative comparison of different regimes

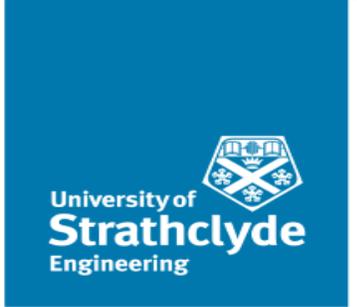

Criteria	Developer led approach	
	Pros	Cons
Planning & Design	<ul style="list-style-type: none"> <li>✓ Co-ordinated development of OWF &amp; OTA's</li> <li>✓ allows bespoke solutions</li> <li>✓ Harmonised interface design</li> <li>✓ Well suited to radial approach</li> </ul>	<ul style="list-style-type: none"> <li>✗ Little incentive to consider future system requirements / long-term planning</li> <li>✗ Less suited to hub or hybrid approaches</li> <li>✗ Still reliant on TSO for onshore reinforcements</li> </ul>
Project Finance	<ul style="list-style-type: none"> <li>✓ Flexible finance structures available - commercial entity</li> <li>✓ Tender process gives high incentive to minimise CAPEX &amp; drive down costs</li> </ul>	<ul style="list-style-type: none"> <li>✗ Higher cost of capital than state backed TSO's</li> </ul>
Project Construction	<ul style="list-style-type: none"> <li>✓ Single entity development of OWF &amp; OTA's</li> <li>✓ Lower interface risk</li> <li>✓ Lower delay risk</li> </ul>	<ul style="list-style-type: none"> <li>✗ Transmission infrastructure non-core business function</li> <li>✗ Higher cost, lower efficiency build than TSO</li> </ul>
Project Operation	<ul style="list-style-type: none"> <li>✓ OWF Developer incentivised to deliver high availability of OTA</li> <li>✓ O&amp;M can be co-ordinated across OWF &amp; OTA asset fleet</li> </ul>	<ul style="list-style-type: none"> <li>✗ Increased response time to grid outages possible due to OTA / onshore TSO interface</li> </ul>

# Qualitative comparison of different regimes

Criteria	Developer led approach	
	Pros	Cons
Planning & Design	<ul style="list-style-type: none"> <li>✓ Co-ordinated development of OWF &amp; OTA's</li> <li>✓ allows bespoke solutions</li> <li>✓ Harmonised interface design</li> <li>✓ <b>Well suited to radial approach</b></li> </ul>	<ul style="list-style-type: none"> <li>✗ Little incentive to consider future system requirements / long-term planning</li> <li>✗ <b>Less suited to hub or hybrid approaches</b></li> <li>✗ Still reliant on TSO for onshore reinforcements</li> </ul>
Project Finance	<ul style="list-style-type: none"> <li>✓ Flexible finance structures available - commercial entity</li> <li>✓ <b>Tender process gives high incentive to minimise CAPEX &amp; drive down costs</b></li> </ul>	<ul style="list-style-type: none"> <li>✗ Higher cost of capital than state backed TSO's</li> </ul>
Project Construction	<ul style="list-style-type: none"> <li>✓ Single entity development of OWF &amp; OTA's</li> <li>✓ <b>Lower interface risk</b></li> <li>✓ Lower delay risk</li> </ul>	<ul style="list-style-type: none"> <li>✗ Transmission infrastructure non-core business function</li> <li>✗ Higher cost, lower efficiency build than TSO</li> </ul>
Project Operation	<ul style="list-style-type: none"> <li>✓ OWF Developer incentivised to deliver high availability of OTA</li> <li>✓ O&amp;M can be co-ordinated across OWF &amp; OTA asset fleet</li> </ul>	<ul style="list-style-type: none"> <li>✗ Increased response time to grid outages possible due to OTA / onshore TSO interface</li> </ul>

# Qualitative comparison of different regimes

Criteria	TSO led approach	
	Pros	Cons
Planning & Design	<ul style="list-style-type: none"> <li>✓ Enables holistic approach to offshore network planning</li> <li>✓ Better suited to hub or hybrid approaches</li> <li>✓ Co-ordinated design can minimise overall OTA investment vs multiple individual projects</li> <li>✓ Potential for standardised designs &amp; economies of scale</li> <li>✓ Integration with onshore grid reinforcements</li> </ul>	<ul style="list-style-type: none"> <li>× New, more complex designs have higher delivery risk</li> <li>× Interface between OWF &amp; OTA</li> <li>× Standardisation can stifle innovation</li> </ul>
Project Finance	<ul style="list-style-type: none"> <li>✓ Government supported TSO has lower cost of capital</li> <li>✓ Single entity with secure project pipeline can minimise procurement costs</li> </ul>	<ul style="list-style-type: none"> <li>× Monopoly approach - low cost pressure, lack of incentive to minimise costs</li> </ul>
Project Construction	<ul style="list-style-type: none"> <li>✓ Can co-ordinate onshore reinforcement work with OTA development</li> </ul>	<ul style="list-style-type: none"> <li>× Interface risks between OTA &amp; OWF</li> <li>× Risk of delays, stranded assets, financial penalties</li> </ul>
Project Operation	<ul style="list-style-type: none"> <li>✓ TSO has large asset base and standardised equipment so can lower OPEX costs</li> <li>✓ Reliability incentivised via reward/penalty system but dependent on regulatory model and criteria set</li> </ul>	<ul style="list-style-type: none"> <li>× Argument that costs can be partially socialised so lower incentive to maximise availability</li> </ul>

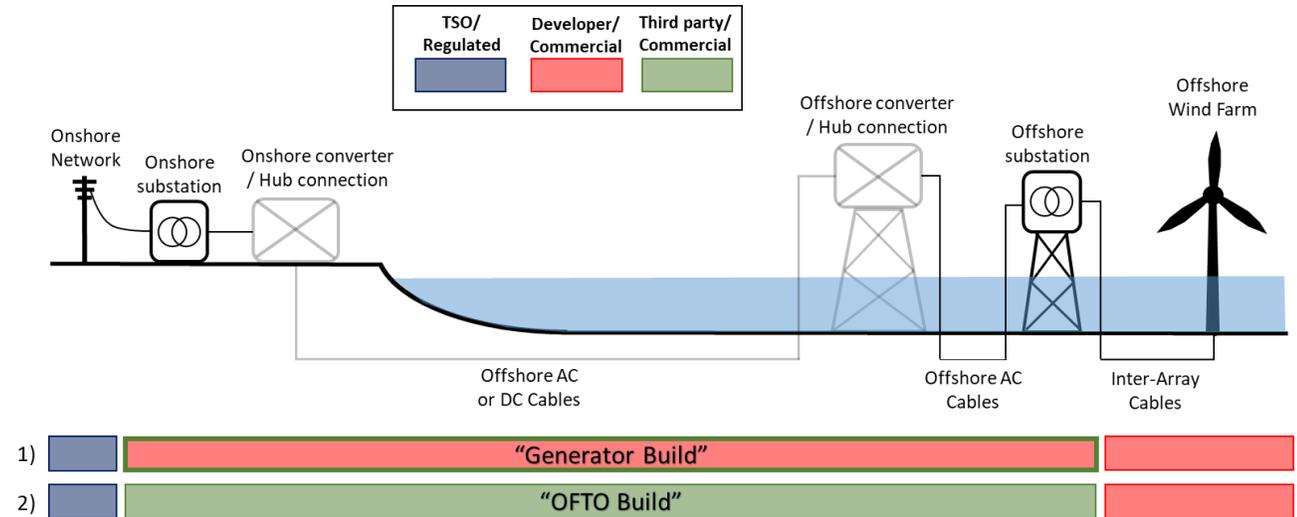

# Qualitative comparison of different regimes

Criteria	Third Party approach	
	Pros	Cons
Planning & Design	<ul style="list-style-type: none"> <li>✓ Depends on the specifications of the tender – potentially suitable for radial, hub or hybrid approaches</li> </ul>	<ul style="list-style-type: none"> <li>× Additional interface - OWF : OTA : TSO</li> </ul>
Project Finance	<ul style="list-style-type: none"> <li>✓ Flexible finance structures available - commercial entity</li> <li>✓ Tender process gives high incentive to minimise CAPEX &amp; drive down costs</li> </ul>	<ul style="list-style-type: none"> <li>× Higher cost of capital than state backed TSO's</li> </ul>
Project Construction		<ul style="list-style-type: none"> <li>× Interface risks between OTA &amp; both OWF &amp; TSO</li> <li>× Risk of delays, stranded assets, financial penalties</li> </ul>
Project Operation	<ul style="list-style-type: none"> <li>✓ Reliability incentivised via reward/penalty system but dependent on regulatory model and criteria set</li> </ul>	

# Country Comparison - UK

## Competitively tendered OFTO regime

- Owner and operator of offshore transmission assets in GB is a separate entity (OFTO)
- “Generator build” option
  - OWF developer has option to build OTA but must sell to OFTO after completion
  - Only option used to date
- “OFTO build” option
  - If OWF developer declines to build the OTA a new tender process would be initiated

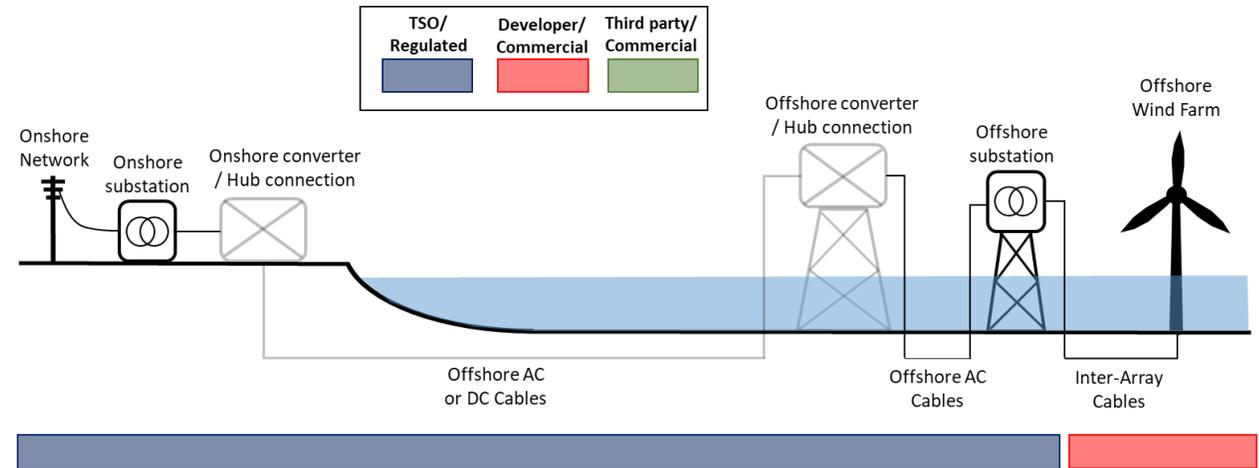

- Only radial developments deployed to date
- Clustering/hub connection possible but subject to single entity success in tender process
- Hybrid connection difficult under OFTO model – legal & regulatory barriers
  - OFTOs & interconnectors treated as separate legal entities
  - Different subsidy regimes

# Country Comparison - Netherlands

## TSO Monopoly on OTA development

- Since 2015 TenneT have operated as “TSO at Sea”
- Grid connection takes place at OWF
  - TenneT fully responsible for building “Grid at Sea”
- Motivated by co-ordinated OWF development
  - Centrally planned roll-out
  - Standardised 700MW design
  - Opportunity to cluster / share assets

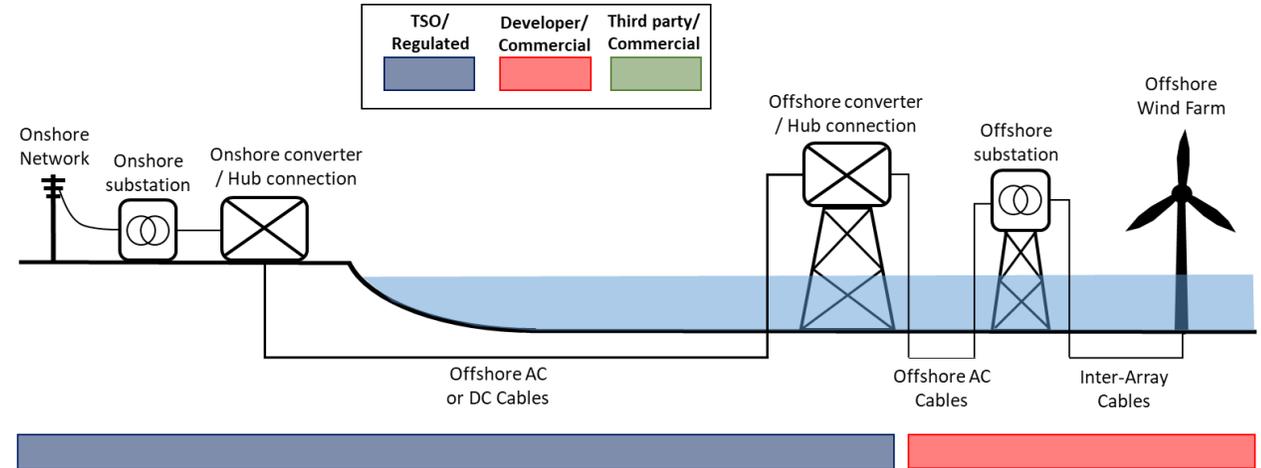

- Largely radial developments with some co-ordination
- Hub connections possible but not implemented
- Hybrid connection should be possible under existing regime with few legal / regulatory barriers
  - TenneT own both interconnectors and “Grid at Sea” so fewer legal barriers to merger

# Country Comparison - Belgium

## TSO Monopoly on OTA development

- Elia responsible for all OTA development
- Modular offshore Grid (MoG) concept
  - Elia build “plug at sea” offshore hub and transmission link to shore
  - OWF developers responsible for connection to offshore hub
- Motivated by co-ordinated OWF development
  - Centrally planned roll-out to minimise total infrastructure

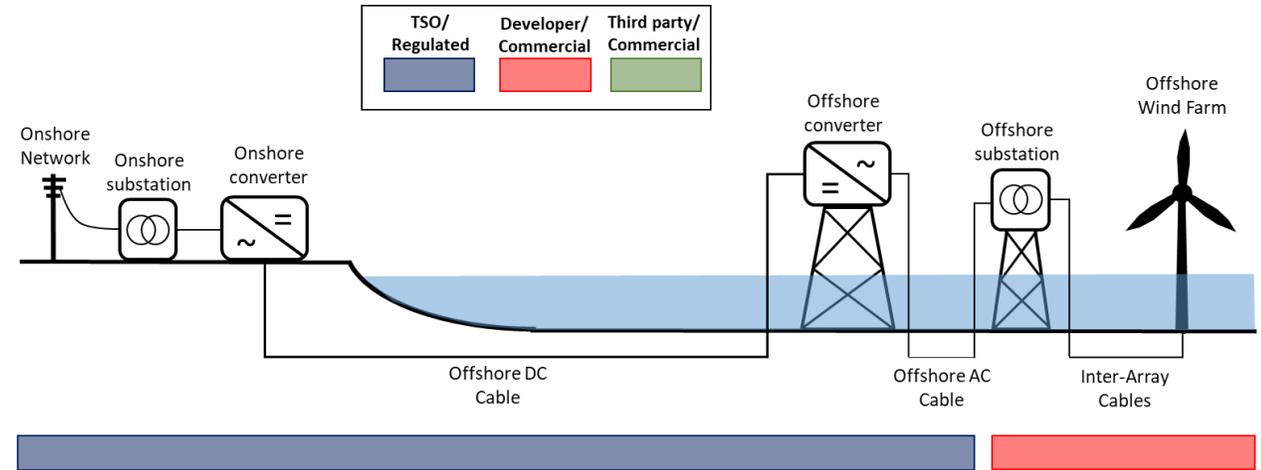

- Hub connections currently being implemented
- Hybrid connections potentially possible under current regime
  - Although 50% TSO ownership rule for interconnectors at present that may be tested in multi-terminal offshore grid scenario

# Country Comparison - Germany

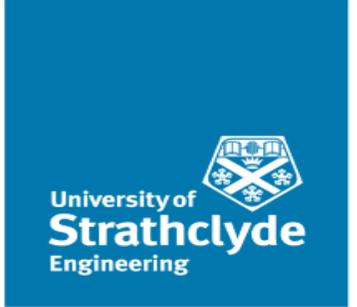

## TSO Monopoly on OTA development

- TenneT (North Sea) and 50Herz (Baltic Sea) responsible for OTA development out to OWF substations
- TenneT 1<sup>st</sup> to make use of large scale HVDC deployment in hub design approach
  - 9 operational HVDC platforms and more under development
- Motivated by co-ordinated OWF development and long distances from shore
- Experienced a number difficulties with project delays / stranded assets / interface issues

- HVDC hub connections already implemented
- 1<sup>st</sup> Hybrid connection under construction with Denmark
- Kriegers Flak Combined Grid Solution
  - 400MW link between existing German and Danish OWFs
  - Facilitated by TSO – TSO co-operation, no third party ownership barriers

# Country Comparison - Denmark

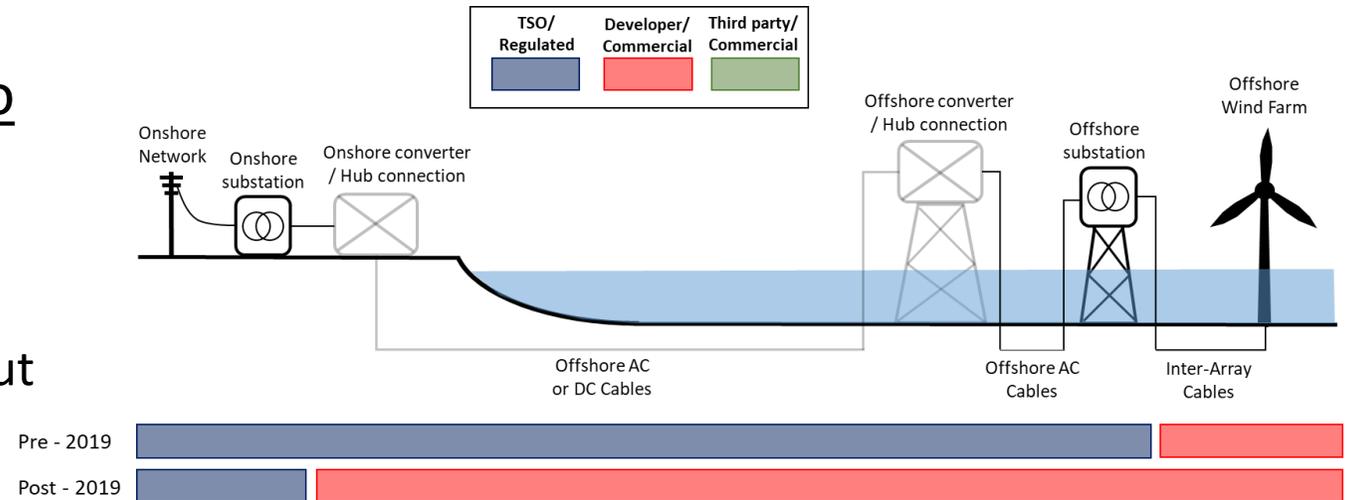

## TSO build model to date but switching to Developer build model

### Pre - 2019

- Energinet responsible for OTA development out to and including OWF substations

### Post - 2019

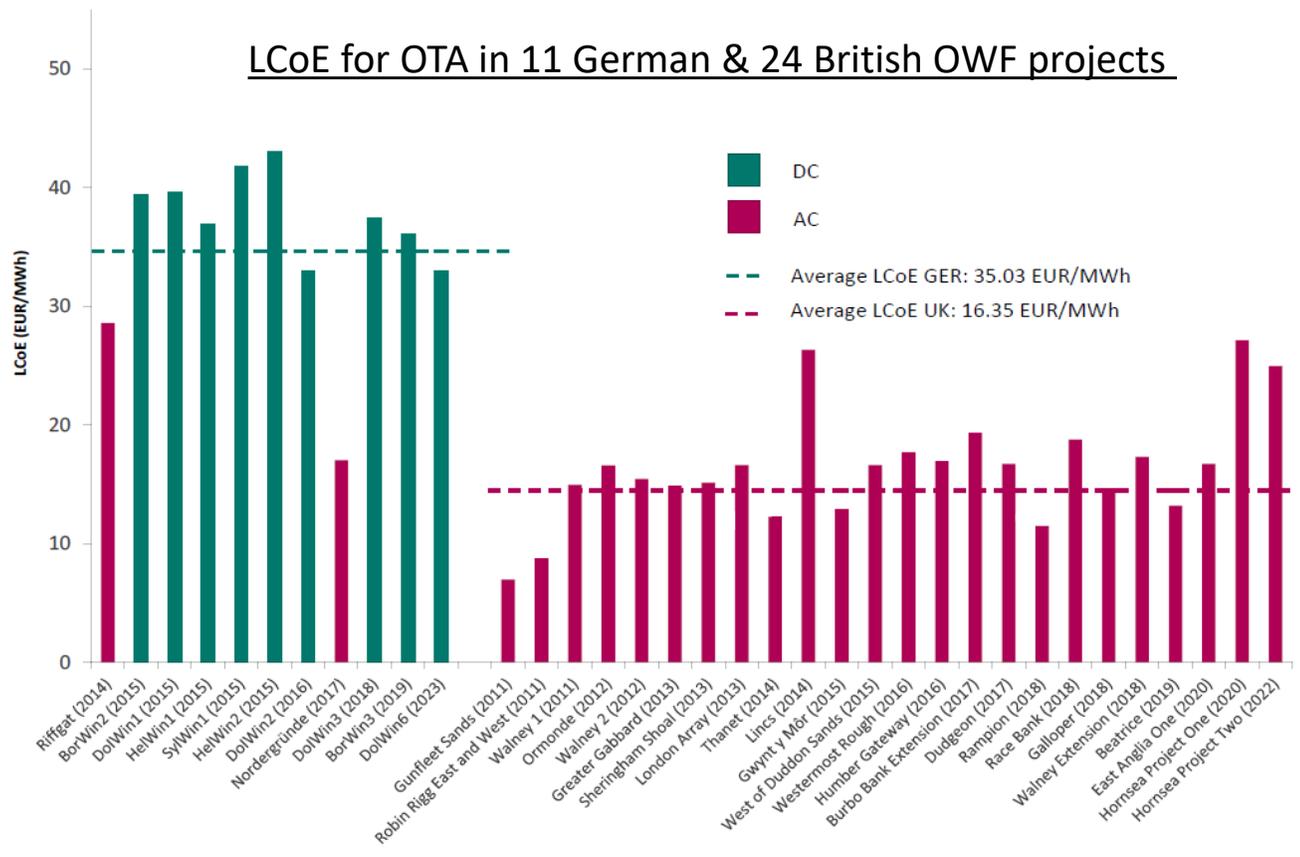

- Tender for new OWF development mandates change to developer build model for OTA's
- Motivated by perception that increased competition will drive faster and more cost effective solutions
  - "Listened to industry"

- Only radial developments deployed to date
- Clustering/hub connection possible within pre-2019 framework but little opportunity to date
- Hybrid grid being implemented under TSO build model
  - Kriegers Flak Combined Grid Solution
- Greater barriers to future replication under Developer build model

# Cost Comparison of Regulatory Regimes

- German report by DIW ECON commissioned by Ørsted Offshore wind:

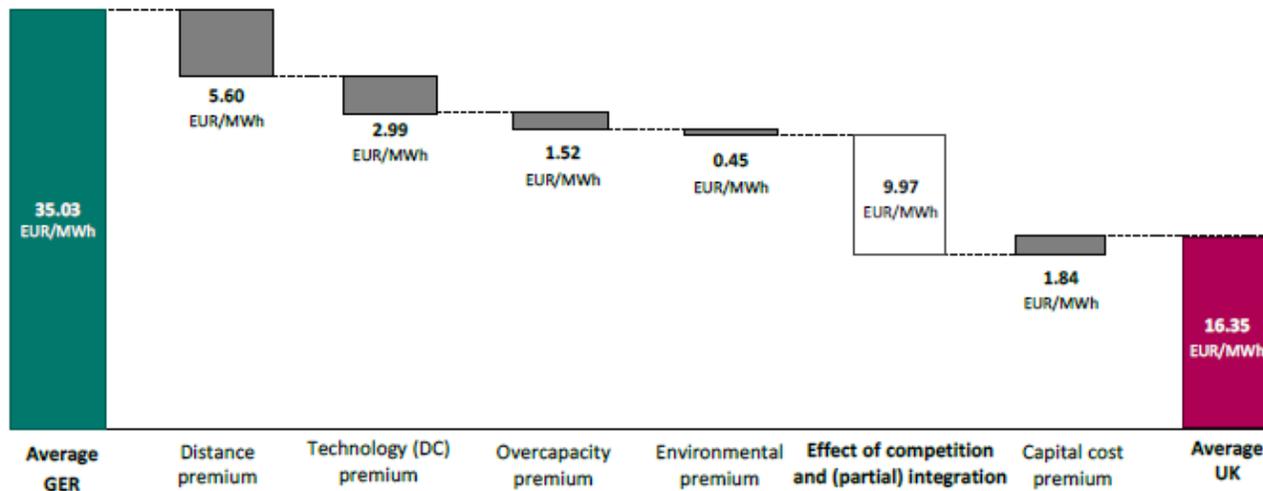

Source: DIW ECON – Market design for an efficient transmission of offshore wind energy, 2019

- Compares GB vs German offshore transmission asset (OTA) developments
- Levelised cost of energy calculation – much higher costs found for German developments
- Even after correcting for distance, technology & other factors still a large gap (€6.7bn to 2030)
- Attribute this to a lack of:
  - i) competition in the regulatory arrangement
  - ii) integration in OWF & OTA development
- Is a comparison between long established near shore HVAC project designs and new far shore HVDC projects really fair?
  - Could natural learning curve drive costs of HVDC options lower in future?

# Cost Comparison of Regulatory Regimes

- German report by DIW ECON commissioned by Ørsted Offshore wind:

Breakdown of average LCoE difference between Germany and the UK

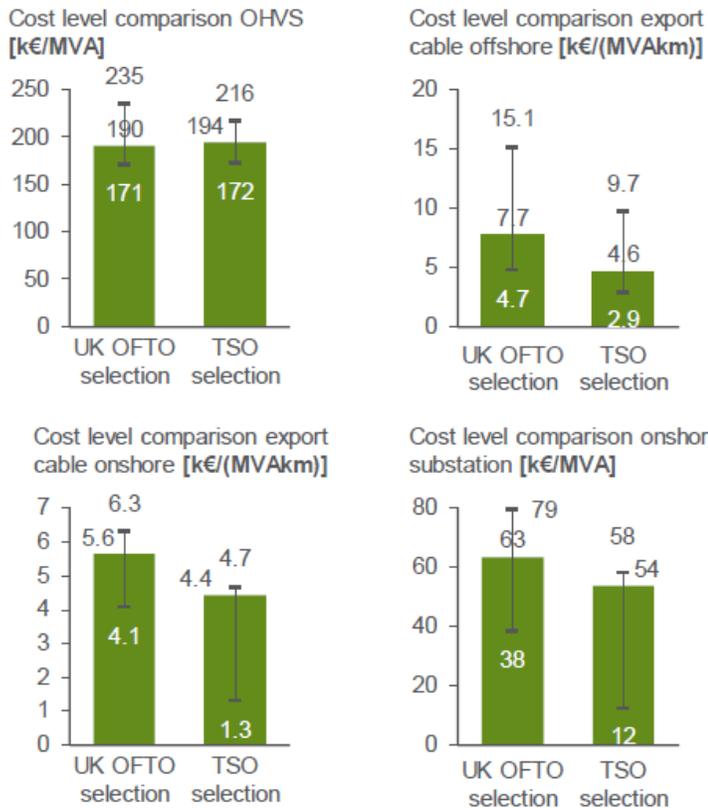

Source: DIW Econ.

- Compares GB vs German offshore transmission asset (OTA) developments
- Levelised cost of energy calculation – much higher costs found for German developments
- Even after correcting for distance, technology & other factors still a large gap (€6.7bn to 2030)
- Attribute this to a lack of:
  - i) competition in the regulatory arrangement
  - ii) integration in OWF & OTA development
- Is a comparison between long established near shore HVAC project designs and new far shore HVDC projects really fair?
  - Could natural learning curve drive costs of HVDC options lower in future?

# Cost Comparison of Regulatory Regimes

- Dutch report by Navigant commissioned by TenneT & RTÉ:

Figure 10. Cost Level Comparison Results (CAPEX only)

Source: Navigant analysis

- Compares six GB OFTO projects vs FR, DK, NL, BE offshore transmission asset developments
- Sub-system level CAPEX comparison made between a range of comparable projects
  - Offshore substation, onshore substation, offshore cable, onshore cable
- UK OFTO projects deemed to be more expensive with higher costs for export cables and onshore substations in particular
- Conclude that TSO development model can be delivered at lower cost than OFTO model even before considering wider system benefits of holistic approach
- Some limitations to approach
  - Relatively small sample of projects
  - Excludes German examples
  - Max GB offshore substation capacity 400MVA vs 800MVA for Dutch comparison. Economies of scale could factor

# Conclusions

- GB OFTO model successful to date
  - Competitive tenders seen to drive down costs but tailored to radial approach
- TSO model allows more co-ordinated approaches
  - Surely required to best facilitate 2030 or 2050 UK OWF capacity targets
    - 30GW by 2030 (Sector deal) - 75GW (CCC) or 80GW (Wind Europe) by 2050
- Is a regulatory model that combines benefits of coordinated planning and high competition possible for future OTA expansion?
  - Needs to ensure certainty & visibility of future OWF pipeline
  - Centrally planned and guaranteed development zones
  - Could “OFTO Build” model be applied to full development zones?
- Co-ordination at national level only 1<sup>st</sup> Step
  - [PROMOTioN](#) project has looked at regulatory options for meshed offshore grid
  - Choice between centrally planned (single regulator/single TSO) and nationally driven approaches with co-operation
